## **Safety and performance enhancement for the complete program of locking overrides made by Master**

The development of **anti-burglary solutions** designed to **improve the sealing performance of door and window frames**, is one of the targets of the engineers working at **MasterLab**, the research centre within which operates **Master Group** testing laboratory. To this end, the company has already launched on the market **HOOK (Art. 4226.X)** the **additional anti-lift locking override for casement frames**, designed to boast simplicity, reduced installation time, aesthetic qualities, and compact size. Actually, **HOOK** features a virtually **invisible locking point applicable to the frame already installed** and, thanks to its **adjustment system**, it improves the sealing of gaskets.

Today, **Master Italy** completes the range of locking overrides with two new solutions that extend the applicability also to **door** and **tilt and turn** product range, as well as to **curtain walls** and folding systems.

The first, the **override art. 4228** is dedicated to door profiles, ideal for the passive sash on the tilt and turn systems, and consists of a **pin in stainless steel AISI 303** that, during sash closing movement, perfectly threads into the special slot of the frame. This accessory guarantees the system the important **anti-lift function** and contributes to the awarding of the **RC2 certification for 2 sash frames**. Easy installation and universal applicability (*on eurogroove frames, R chamber and door series*) complete the features of an important product that meets the ever-growing market demand for improved safety performance.

**Curtain walls** and **folding systems** made by **Master Italy** are equipped with the **override art. 4227**, which is a system made with an insert and a zama punch that perfectly match when the sashes are in the closing position, ensuring, once again, an **anti-lifting function**. In addition to improving security, this override that can be applied to eurogroove chamber profiles, R chamber, curtain walls and folding openings, is very useful in the presence of large mirrors since it acts as an **additional lock**, greatly increasing system performance in terms of tightness and durability.

With the **override program**, **Master Italy**, offers a truly complete solution to **security** and **performance** demands, covering many types of opening systems installed on all popular systems available on the market.
